Problem A

Number Maze

Consider a number maze represented as a two dimensional array of numbers comprehended between 0 and 9, as exemplified below. The maze can be traversed following any orthogonal direction (i.e., north, south, east and west). Considering that each cell represents a cost, then finding the minimum cost to travel the maze from one entry point to an exit point may pose you a reasonable challenge.

0	3	1	2	9
7	3	4	9	9
1	7	5	5	3
2	3	4	2	5

Problem

Your task is to find the minimum cost value to go from the top-left corner to the bottom-right corner of a given number maze of size *NxM* where *1 <= N, M <= 999*. Note that the solution for the given example is 24.

Input

The input file contains several mazes. The first input line contains a positive integer defining the number of mazes that follow. Each maze is defined by: one line with the number of rows, *N*; one line with the number of columns, *M*; and *N* lines, one per each row of the maze, containing the maze numbers separated by spaces.

Output

For each maze, output one line with the required minimum value.

Sample Input

```
2
4
5
0 3 1 2 9
```

```
7 3 4 9 9
1 7 5 5 3
2 3 4 2 5
1
6
0 1 2 3 4 5
```

Sample Output

```
24
15
```
